RAKATHON

Beyond the hackathon

Oncology solutions that work beyond one hospital

HOSPITALS ON FHIR | PHOENIX | XiA

Luc Chatty | Fyrstain · HL7 Europe · Hospitals on FHIR

15 OCT 2026

A convincing prototype is just the beginning.

The real test is whether another hospital can understand, trust and use it.

48 HOURS

Prototype

A great clinical idea.
An impressive demonstration.

FIRST HOSPITAL

Integration

Different systems, identities, workflows and terminology.

SECOND HOSPITAL

Portability

Can the team deploy it without rebuilding everything?

The goal: move from a one-off application to a reusable clinical solution.

FHIR is the shared contract. Not a magic plug.

Make the exchange predictable; agree what the exchanged information means.

Profiles
Which rules?

Terminology
Which meaning?

Security
Who can access?

Workflows
When and why?

"We store JSON" does not mean "we are interoperable."

The implementation community.

Hospitals on FHIR puts real hospital constraints into the interoperability conversation.

Hospitals HL7 FHIR

Community before technology

An HL7 Europe initiative, built around healthcare providers and the people implementing FHIR.

01 **Cooperate**

Share hospital experience, lessons and implementation needs.

02 **Adopt progressively**

Learn and increase interoperability maturity step by step.

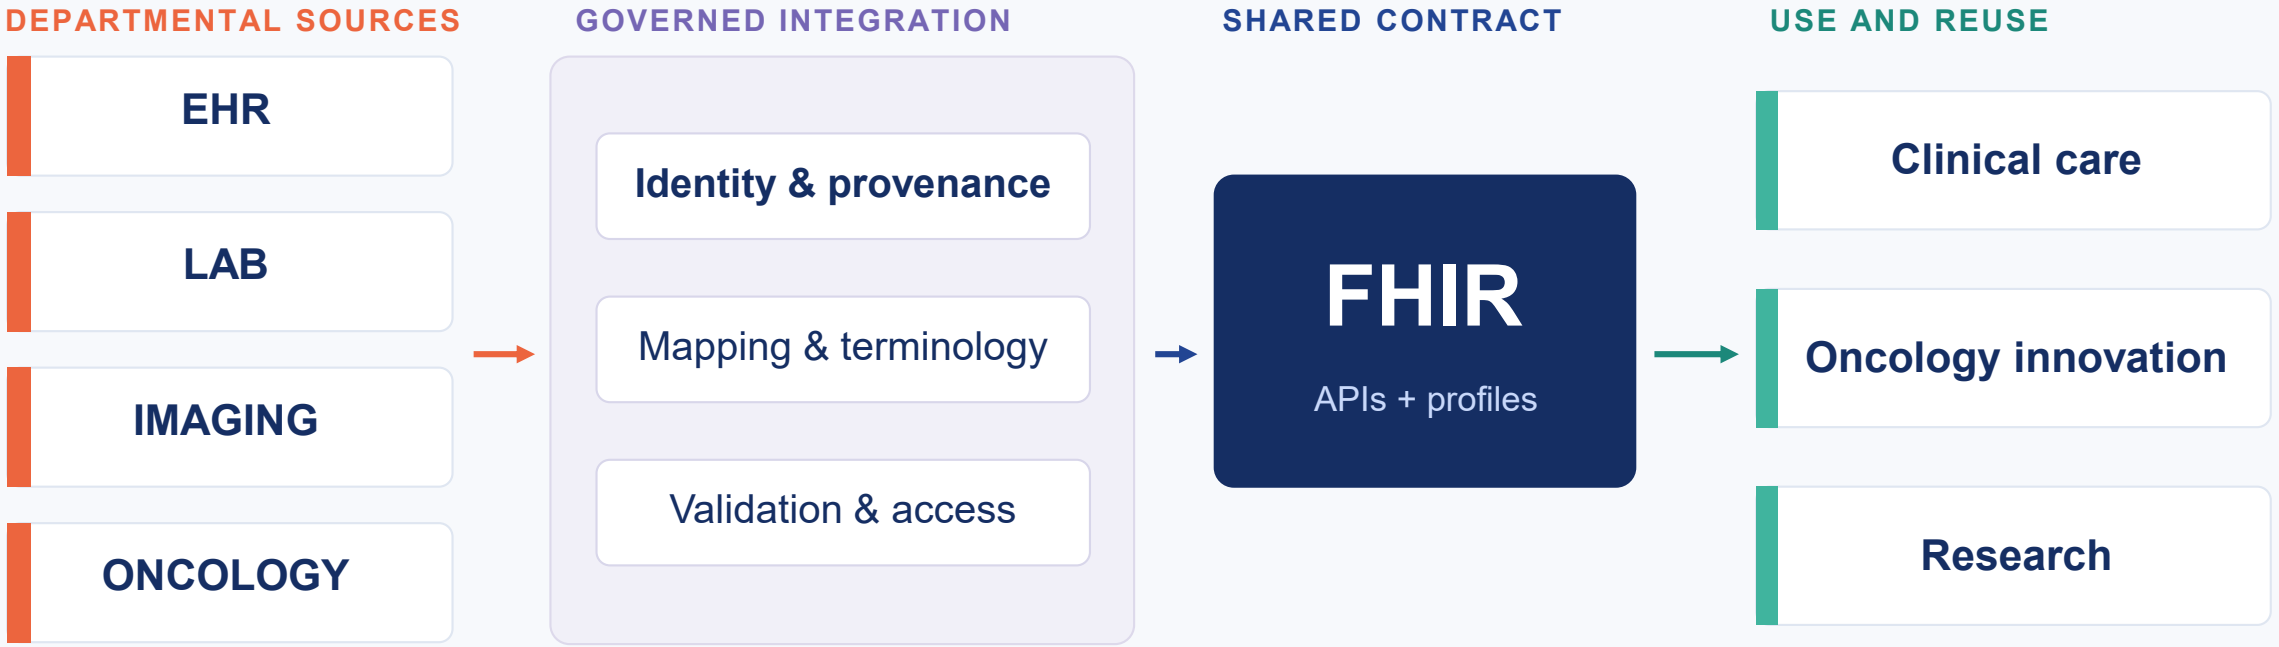

03 **Validate in reality**

Connect implementers to hospital workflows and use cases.

HL7 Europe

From hospital silos to reusable services.

Illustrative interoperability architecture: local systems remain, shared interfaces emerge.

The point is not to replace the hospital; it is to make its data usable through agreed services.

EHDS: from hospital adoption to oncology.

One European framework. Two complementary ways to make it work.

EHRxF
EUROPEAN ELECTRONIC HEALTH RECORD EXCHANGE FORMAT

EHDS

EUROPEAN HEALTH DATA SPACE

Interoperable exchange & reuse · EEHRxF · Cross-border care

HOSPITALS ON FHIR

HOSPITAL IMPLEMENTATION COMMUNITY

Helps hospitals adopt EHDS-aligned interoperability through FHIR, shared experience, testing and gradual implementation.

PHOENIX

ONCOLOGY SPECIALISATION · AMBITION

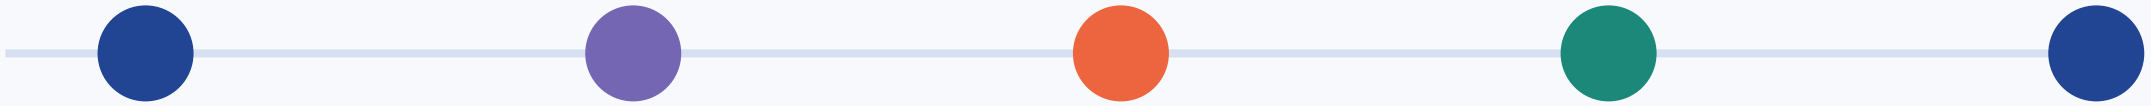

Aims to develop an EHDS-aligned cancer data model and FHIR implementation guidance for care and research reuse.

Find our examples here: https://synderai.net/

HL7 Europe

A cancer journey is not a single record.

Clinical decisions evolve over time, across departments, teams and organisations.

Diagnosis

Tumour type

Staging

Extent of disease

Treatment

Therapies & events

Response

Assessments

Follow-up

Longitudinal status

Direct care: decisions, context, workflow

Research: observations, cohorts, reuse

PHOENIX
an HL7 Europe initiative

Why PHOENIX? Why now?

A European effort to align cancer care, standards developers and implementers.

01

Standards take time

Healthcare adoption is too slow for each organisation to work alone.

02

Different priorities

Hospitals, vendors and researchers need shared requirements.

03

Cross-border reality

Common interpretation matters beyond a single country.

Bring the oncology community together: care first, research and reuse next.

HL7 Europe

PHOENIX
an HL7 Europe initiative

A European Common Cancer Data Model.

A common clinical language, with an evolving HL7 FHIR implementation pathway.

Clinical meaning

What happened to the patient?
What did clinicians decide?

→

Shared cancer model

Concepts, relationships, journeys and meaning.

→

FHIR artefacts

Profiles, value sets, Implementation Guides.

→

Implementers

Hospitals, researchers and oncology applications.

Use existing international work such as mCODE as input; address European clinical and EHDS contexts.

PHOENIX specifications are under development: https://build.fhir.org/ig/hl7-eu/cancer-common/ .

PHOENIX
an HL7 Europe initiative

What should an oncology prototype describe?

Link the clinical journey to explicit, testable data structures.

1	2	3	4	5
Person & visit	**Cancer diagnosis**	**Tests & reports**	**Treatment events**	**Response over time**
Patient · Encounter	Condition · Observation	DiagnosticReport · Specimen	Procedure · MedicationAdministration	Observation · clinical context

Real interoperability also needs terminology, patient context, provenance and validation.

Illustrative FHIR resource choices.

“The only way forward, is together.

Help us shape the oncology standards of the future.

Standards do not implement themselves.

XiA builds the interoperability skills needed to make EHDS adoption practical.

XiA

Xpanding Innovative Alliance

EU co-funded / 2025–2028

Open learning resources

Modular training on interoperability standards and the EHDS.

Learning pathways

Progression towards micro-credentials and recognised skills.

Learning by doing

Educathons and practical activities around real challenges.

Example: https://learn-health-data-exchange.netlify.app/en/

Train the team, not just the model.

A modular learning journey that mirrors a real implementation project.

01

UNDERSTAND

FHIR resources & APIs
Clinical context

→

02

SPECIFY

Profiles & IGs
Terminologies

→

03

IMPLEMENT

Data mapping
Workflow integration

→

04

VALIDATE

Conformance tests
Safety & governance

Microcontent → **Microcourses** → **Micro-credentials**

XiA is developing and validating these modular learning pathways over the course of the project.

Three initiatives. One deployment pathway.

None of these efforts is sufficient on its own.

WHERE?

HOSPITALS ON FHIR

Hospitals, operational workflows and real-world feedback.

WHAT?

PHOENIX

Shared European oncology semantics and specifications.

HOW?

XiA

The skills and training to implement interoperable solutions.

REAL NEEDS → SHARED LANGUAGE → REAL CAPACITY

Six choices that help your oncology solution travel.

A practical checklist for the first 48 hours.

01 **Start with the workflow**

Who makes the decision, using which clinical context?

02 **Choose FHIR contracts**

Prefer reusable resources and established profiles.

03 **Reuse coding systems**

Do not hide local meanings in ad-hoc strings.

04 **Plan trust from day one**

Identity, access, provenance and safety matter.

05 **Test outside your demo**

Use realistic datasets and validate instances.

06 **Share the artefacts**

Document mappings, assumptions, examples and tests.

Your future customer is not only the clinician: it is also the next hospital.

DON'T JUST WIN THE HACKATHON.

Make the next hospital say yes.

Come build the European oncology interoperability ecosystem with us.
